INSTALLATION AND USAGE GUIDE

Schedule Assistant

Your meetings, tasks and reminders — in one calm, private place.

This guide takes you, step by step and with no programming knowledge needed, from the downloaded file to a working assistant: installed on your Windows laptop, connected to your Google account, mirrored in a Google Drive worksheet, available on your Android phone, and sending you an email reminder 30 minutes before every meeting.

Creator: Dr. Asif Ahmad
App: Asif Schedule Assistant
Default account: asifahmad1@gmail.com
Time to set up: about 30–45 minutes, once only
App address on your laptop: `http://127.0.0.1:4318`

> **Read this first.** Follow the chapters in order the first time. Chapter 4, Connecting Google, is the longest part — it is a one-time setup that Google requires you to do yourself. After that, daily use is just Chapter 7, and the last page of this guide is a one-page card you can keep beside your laptop.

What you will have when you finish

- A schedule you can open in your browser, with meetings, tasks and appointments in Pakistan time.
- An inbox that collects meeting invitations from Gmail for your approval — nothing is added without you saying yes.
- The same events in Google Calendar, when you choose to save them there.
- A worksheet in Google Drive that updates itself within seconds of every change.
- An email reminder 30 minutes before each event, and the app on your phone’s home screen.

CONTENTS

How this guide is organised

Chapters 1–6 are setup: you do them once. Chapters 7–8 are daily life with the app. Chapters 9–11 are there for when something goes wrong, when you want to stop or remove the app, and as a quick reference.

1	What the app does	3
2	Before you start — what you need	4
3	Installation on your Windows laptop	5
4	Connecting Google — the one-time setup	7
5	Your Google Drive worksheet	10
6	Installing the app on your Android phone	11
7	Daily use — every page explained	12
8	Reminders explained	15
9	Troubleshooting	16
10	Stopping, disconnecting and uninstalling	17
11	Quick-reference card	18

Words used in this guide

- **The black window** — the small window that opens when you start the app. It is the app itself running. Keep it open; you can minimise it.
- **Browser** — Google Chrome, where you view and use the app.
- **Event** — any meeting, task or appointment you save in the app.
- **Worksheet** — the spreadsheet the app keeps for you in Google Drive, named *Asif Schedule Assistant*.
- **Pakistan time** — all dates and times in the app are shown in Asia/Karachi time (UTC+5), wherever the event came from.

> **No programming, ever.** You will never need to type a command or edit code. Every step in this guide is a click, a double-click, or typing an ordinary address or name.

CHAPTER 1

What the app does

Schedule Assistant is a private app that runs on your own laptop. It keeps your meetings and tasks, watches for invitations in your email, keeps Google Calendar and a Drive worksheet in step, and reminds you before everything — automatically.

Your meetings and tasks, in one place

You add a meeting, task or appointment once — title, date, Pakistan time, duration, location and notes. You can search the list, filter it (upcoming, all, completed, cancelled), edit any entry, and mark it completed or cancelled. Your records are stored on your own computer, so they survive closing the browser and restarting the laptop.

An inbox for Gmail invitations

Once Google is connected, the app looks at your Gmail for messages that look like meeting invitations and collects them in an **Invitation inbox**. It suggests the date and time it finds — in English — but it never schedules anything on its own. You review each suggestion and approve it, change it, or ignore it. You can also paste an invitation from any message yourself.

Google Calendar sync

Connected to Google, the app syncs with Google Calendar every five minutes. Calendar events appear under **My schedule**, and when you save one of your meetings **to Google**, it gains Google Calendar's own email and pop-up reminders as a backup.

A Drive worksheet that updates itself

The app creates a Google Drive spreadsheet named *Asif Schedule Assistant*. Every entry becomes a row, and every change — new, edited, completed, cancelled — reaches the worksheet within seconds. A Dashboard tab keeps live counts, so you can glance at your whole schedule from any device, even when the laptop is off.

A reminder 30 minutes before

For every scheduled event, the app sends you a Gmail reminder 30 minutes before it starts, and shows it on the dashboard too. Chapter 8 explains exactly how reminders behave, including what happens if the laptop was asleep.

Add event → **Saved on laptop** → **Row in Drive worksheet** → **Optional: Google Calendar** → **Email reminder, 30 min before**

> **One honest limit.** Reminders and syncing only work while the app is running and the laptop is awake and online. That is why saving important meetings to Google — Chapter 7 — is the safety net: Google's own reminders work even if this app is off.

CHAPTER 2

Before you start — what you need

Setup takes about 30–45 minutes, and most of that is the one-time Google connection in Chapter 4. Gather these five things first and the rest follows easily.

You need	Details
A Windows laptop	Windows 10 or Windows 11. The app runs on this laptop; your phone is only a window onto it.
Internet	Needed for the first download of the app's parts, for Google sign-in, and whenever reminders and syncing run.
Google Chrome	The browser you will open the app in, on laptop and phone. Chapter 3, Step 2 shows how to install it if you do not have it.
A Google account	Use **asifahmad1@gmail.com** — the app's default account. Have its password ready for Google's own sign-in pages. You will never type that password into the app itself.
The app file	**Asif-Schedule-Assistant.zip** — the download that contains the app and its setup files.
About 30–45 minutes	Uninterrupted time for Chapters 3 and 4. Daily use afterwards takes seconds.

Two good habits before you begin

- **Plug the laptop in.** The first start downloads parts for 2–5 minutes, and the Google steps involve several pages. A laptop that sleeps mid-setup is the most common cause of confusion.
- **Keep this guide open or printed.** Chapter 4 asks you to move between the Google Cloud website and the app several times. Work through its numbered steps in order and tick them off as you go.

> **Your data stays yours.** The app runs only on your laptop and talks to your own Google account. Your records live in a protected folder on your computer; Google sign-in details are stored encrypted on the same machine. Nothing is sent anywhere else.

If you use a Mac or Linux instead

The app also runs there: instead of `Start-Windows.cmd`, you run `bash start.sh` and open the same address, `http://127.0.0.1:4318`. Everything from Chapter 4 onwards is identical. The rest of this guide follows the Windows path.

CHAPTER 3

Installation on your Windows laptop

Four steps: install the engine, confirm the browser, give the app a permanent home, and start it for the first time.

Step 1 — Install Node.js, the engine the app runs on

1. Open `https://nodejs.org` in your browser.
2. Download the **LTS** version for Windows — the big green button. LTS means the long-term, stable version; the app needs version 24 or newer.
3. Open the downloaded file and click **Next** through everything, accepting all defaults, then **Finish**.

You never need to open Node.js itself. The app uses it quietly in the background.

Step 2 — Make sure Google Chrome is installed

If you already use Chrome, skip this step. Otherwise go to `https://www.google.com/chrome`, click **Download**, open the file and follow the prompts.

Step 3 — Unzip the app into a permanent home

1. Find **Asif-Schedule-Assistant.zip**, probably in your **Downloads** folder.
2. Right-click it, choose **Extract All…**, and choose a permanent place — for example `C:\Users\YourName\Asif-Schedule-Assistant`.
3. Open that folder. You should see files including `Start-Windows.cmd`, `Start-Phone-Access.cmd`, `server.mjs` and `EASY-SETUP.md`.

> **Do not run the app from inside Downloads or from inside the zip.** Downloads folders get cleaned up, and a zip is read-only. A permanent folder means the app — and the shortcut habits you build around it — keep working.

Starting the app for the first time

Step 4 — Double-click Start-Windows.cmd

1. In the app folder, double-click **Start-Windows.cmd**.

2. A black window opens. The first time only, the app downloads its own parts — this needs internet and takes about **2–5 minutes**. Lines of text scrolling past are normal. Later starts are almost instant.

3. Your browser should open the app by itself at `http://127.0.0.1:4318`. If it does not, open Chrome and type that address exactly, then press Enter.

4. You should see the Schedule Assistant opening page — “A clear plan. A calmer day.” — with **“Created by Dr. Asif Ahmad”** at the bottom of the page.

> **The golden rule: keep the black window open.** That window is the app running. You may minimise it and close the browser — reminders keep working. But if you close the black window, the app stops: no reminders, no syncing, and the browser page will say it cannot be reached. Chapter 10 shows how to stop it properly, and restarting is always just another double-click of `Start-Windows.cmd`.

What the address means

`127.0.0.1` means “this computer”. The app page exists only on your laptop — nobody on the internet can open it. The phone version in Chapter 6 uses a different, home-network address, and only inside your own Wi-Fi.

Quick check before you move on

- ☐ The black window is open and has finished its first download.
- ☐ Chrome shows the Schedule Assistant at `http://127.0.0.1:4318`.
- ☐ You can see the left-hand menu: Overview, My schedule, Invitation inbox, Connections, Reminder history, Settings.

If the page will not open, turn to the first two rows of the troubleshooting table in Chapter 9 — then come back here. Next: connecting Google, the step that switches on invitations, calendar sync, the Drive worksheet and email reminders.

CHAPTER 4

Connecting Google — the one-time setup

This is the longest step in the guide, and you only do it once. Google requires every personal app to be registered by its owner — that owner is you.

There are four parts: **(a)** create a Google Cloud project, **(b)** switch on four Google services, **(c)** set up the permission screen, and **(d)** create a sign-in key file, upload it into the app, and sign in. Work in order, and sign in everywhere with **asifahmad1@gmail.com**.

Part A — Create the project

1. Go to `https://console.cloud.google.com` and sign in with **asifahmad1@gmail.com**.
2. At the top of the page, click the project dropdown — it may say “Select a project” — then click **New Project**.
3. Name the project **Asif Schedule Assistant** and click **Create**.
4. Wait about 30 seconds, then open the project dropdown again and select **Asif Schedule Assistant**, so everything that follows happens inside it.

Part B — Enable the four Google services

In the left-hand menu, go to **APIs & Services** → **Library**. For each service below: search for its name, click it, and click **Enable**. Then return to the Library for the next one.

Service to enable	What it gives the app
Gmail API	Finding invitations in your email and sending your reminders.
Google Calendar API	Reading and creating calendar events.
Google Drive API	Creating and finding your worksheet file.
Google Sheets API	Writing rows, colours and counts into the worksheet.

Four services, four Enable clicks. If a service shows “Manage” instead of “Enable”, it is already on — move to the next.

The permission screen and the five scopes

Part C — Configure the OAuth consent screen

This screen is what Google shows you when the app asks permission. “OAuth” is simply Google’s name for that permission system.

1. Left-hand menu: **APIs & Services → OAuth consent screen**. Choose **External**, then click **Create**.

2. Fill in: App name — **Asif Schedule Assistant**. User support email — your email. Developer contact email — your email. Click **Save and Continue**.

3. On the **Scopes** page, click **Add or Remove Scopes**. Tick the five scopes in the table below, then click **Update**, then **Save and Continue**.

Scope to tick	In plain words
`https://www.googleapis.com/auth/gmail.readonly`	Read email, to find invitations. Read-only.
`https://www.googleapis.com/auth/gmail.send`	Send email as you — used only for your own reminders.
`https://www.googleapis.com/auth/calendar.events`	Read and create calendar events.
`https://www.googleapis.com/auth/drive.file`	Work only with files the app itself creates — your worksheet.
`https://www.googleapis.com/auth/spreadsheets`	Write into spreadsheets — the worksheet rows and dashboard.

4. On the **Test users** page, click **Add Users**, enter **asifahmad1@gmail.com**, and click **Save**. This tells Google that you — and only you — may use the app while it is in test mode.

> **Why “test mode” is fine.** Your app is private and personal; it does not need Google’s public review. Test mode simply means Google may ask you to sign in again about every 7 days — one click in the app’s Connections page, explained on the next page.

The key file, upload, and sign-in

Part D — Create the Desktop client and download its file

1. Left-hand menu: **APIs & Services** → **Credentials**. Click **Create Credentials** → **OAuth client ID**.
2. Application type: **Desktop app**. Name: **Asif Schedule Assistant**. Click **Create**.
3. Click **Download JSON** and save the file somewhere findable, such as Downloads. This file is the app's key — not your password — and the app keeps it encrypted.

Part E — Upload the file and sign in, inside the app

1. Return to the app in Chrome (`http://127.0.0.1:4318`) and open **Connections** in the left menu.
2. Under **Gmail & Google Calendar**, click **Upload** (labelled "1. Upload Google Desktop OAuth JSON") and choose the JSON file you just downloaded.
3. Click **Sign in with Google** ("2. Sign in with Google"). Choose **asifahmad1@gmail.com**, tick the permission boxes Google shows, and click **Continue**.
4. The status badge changes to **Connected**. Click **Sync now**. Calendar events appear under My schedule, and invitation suggestions begin to appear in the Invitation inbox.

> **The "unverified app" warning is expected.** Google has not reviewed your personal app. Click **Advanced**, then **Go to Asif Schedule Assistant**. Only do this for an app you created yourself — never for a stranger's app.

> **The 7-day note.** In test mode, Google may expire the connection after about 7 days. Nothing is lost. Open **Connections** and click **Sign in with Google** again — the upload step does not need repeating.

- ☐ Status in Connections says **Connected**, for asifahmad1@gmail.com.
- ☐ You clicked **Sync now** and saw a sync time, not an error.

CHAPTER 5

Your Google Drive worksheet

You do not create the worksheet — the app does, the moment Google is connected. It is named *Asif Schedule Assistant* in your Google Drive, and it keeps itself up to date.

The Schedule tab — every entry, one row

Each meeting, task or appointment becomes one row with these columns:

Columns	What they hold
Title · Type	The event name, and whether it is a meeting, task or appointment.
Date · Start · End · Duration	The day, start and end in **Pakistan time**, and how long it runs.
Location	Room, office, or meeting link, as you entered it.
Status	Scheduled, completed or cancelled — **colour-coded**: green for scheduled, blue for completed, red for cancelled.
Reminder time · Notes · Source · Last updated	When the 30-minute reminder falls, your notes, where the entry came from, and when the row last changed.

The header row stays frozen and has filters, so a long schedule is easy to scan and sort.

The Dashboard tab — live counts at a glance

Total · Upcoming · Due today

How much is on your plate, and what needs attention today.

Completed · Cancelled

What is done, and what was called off — counted automatically.

The Dashboard also shows the **last-sync time** and your creator credit. Its counts are live formulas that recalculate the moment the Schedule tab changes.

How and when it updates

- Every create, edit, completion or cancellation triggers an update **within seconds**.
- To force an update: **Connections** → **Google Drive worksheet** → **Sync worksheet now**. The same panel shows the status and an **Open worksheet** link.
- You can also open it from Google Drive or Sheets, on any device signed in as asifahmad1@gmail.com.
- Disconnecting Google does not delete the worksheet — it stays in your Drive as your copy.

> **The worksheet is the mirror and the backup.** The laptop app is the original; the worksheet mirrors it live in Drive, readable anywhere you can open Google Drive.

CHAPTER 6

Installing the app on your Android phone

Your laptop runs the app; your phone simply opens it like any other app. Once installed, an icon sits on your home screen and the app runs full-screen.

> **Two rules first.** Laptop and phone must be on the **same Wi-Fi**. And do the Google sign-in (Chapter 4) from the **laptop** browser, not the phone.

1. On the laptop, in the app folder, double-click **Start-Phone-Access.cmd** instead of Start-Windows.cmd. Keep its black window open.
2. The black window prints a phone address, for example `http://192.168.1.5:4318`. Your numbers may differ — copy the address exactly as printed.
3. On your Android phone, open **Chrome** and type that exact address, then go.
4. The Schedule Assistant opens, with your creator credit at the bottom. Tap Chrome's ⋮ **menu** (top right), then **Add to Home screen**, then **Install**.
5. An app icon appears on your home screen. Tap it any time to open your schedule full-screen.

Good to know

- The phone address only works at home, on your own Wi-Fi, while the laptop app is running. It is not exposed to the internet — never set up port forwarding for it.
- If your router restarts, the printed address can change. Run `Start-Phone-Access.cmd` again and read the new address.
- Everything you do on the phone — adding, editing, completing — is the same live schedule, and the Drive worksheet updates just the same.
- If Windows Firewall asks whether Node.js may use the network the first time, allow it for your private/home network, or the phone will not get through.

CHAPTER 7

Daily use — the Overview and My schedule

The left-hand menu has six pages. This chapter walks through each one: what it shows, and exactly what to click.

Overview — your day at a glance

The page the app opens on. Across the top are four numbers: **today's schedule**, **coming up this week**, **invitations to review**, and your **default reminder — 30 min**. Below them, **Up next** shows your next event, a panel summarises your Google connection, and **Your week at a glance** lays out the week: use the arrow buttons to move between weeks, **Today** to come back, and click any day to start a new event on that day. Dots mark meetings, tasks and appointments in different colours.

The one button to know: `+ NEW EVENT` — top right, on several pages. It is how every event begins.

My schedule — the full record

Every meeting and task you keep, in one list.

- **New event:** click **+ New event**. Fill in the title; choose the type (Meeting, Task or Appointment); set the date and start time — both in Pakistan time; pick a duration (30 minutes to 4 hours); add a location or meeting link and any notes. The form reminds you on screen: "Reminder: 30 minutes before". Click **Save event**.
- **Search:** type in the **Search your schedule…** box to filter the list as you type.
- **Filter:** use the dropdown beside the search box — **Upcoming**, **All records**, **Completed** or **Cancelled**.
- **Edit:** open an event, change what you need, and save. The Drive worksheet row updates within seconds.
- **Complete or cancel:** open the event and use its complete or cancel action. Completed and cancelled events stay in your records — and in the worksheet, colour-coded — rather than disappearing.
- **Save to Google:** on an event, click **Save to Google** to also place it in Google Calendar. This is the important one for critical meetings: Google then sends its own 30-minute email and pop-up reminders, which work even if the app or laptop is off.

> **Habit worth building:** ordinary entries live happily in the app alone. Anything you cannot afford to miss — an exam duty, a flight, a rector's meeting — gets **Save to Google** as well. Two reminder systems are better than one.

Invitation inbox and Connections

Invitation inbox — from conversation to calendar

When Google is connected, emails that look like invitations collect here, each with the date and time the app suggests. Nothing is scheduled until you approve it.

- **Review a suggestion:** open a suggestion, check the title, date and time it found, correct anything, and approve it to add it to My schedule — or dismiss it if it is not an event.
- **Paste invitation:** click **+ Paste invitation**, give it a title, choose the source (Email or Other text), paste the full message, and click **Review invitation**. The suggestion lands in the inbox for the same review.
- **Languages:** the date-finding works on English text. For invitations in other languages, read the date yourself and create the event manually with **+ New event**.
- The number badge beside **Invitation inbox** in the menu tells you how many suggestions are waiting.

Connections — the control panel for Google

One page holds the Google connection, the worksheet, and the reminder note. Use **Refresh status** (top right) whenever you want the badges re-checked.

Control	What it does
Upload (OAuth JSON)	Loads the key file from Chapter 4. Needed once, and again only if you create a new key.
Sign in with Google	Connects the account — and the fix whenever Google says access has expired (about every 7 days in test mode).
Sync now	Immediately syncs Gmail invitations and Google Calendar, instead of waiting for the automatic five-minute cycle.
Disconnect	Disconnects Google from the app. Your records and the Drive worksheet remain.
Open worksheet	Opens the *Asif Schedule Assistant* spreadsheet in Drive.
Sync worksheet now	Forces the worksheet to update immediately and shows its status and last-sync details.

The same page carries a plain reminder: background reminders need the app running. The browser may be closed — the black window may not.

Reminder history, Settings, and your first test

Reminder history — proof of every reminder

A record of every reminder the app has handled, with its delivery status — accepted, unconfirmed, or shown on the dashboard. If a reminder for an unconfirmed delivery needs another attempt, this page offers an explicit **retry**: unconfirmed reminders are never replayed automatically, so a duplicate never lands in your inbox by surprise. Chapter 8 explains the statuses in full.

Settings — set it up for your day

- **Your Google email:** the account reminders and syncing belong to — asifahmad1@gmail.com. If you ever change it, the Google connection must match it.
- **Time zone:** fixed at Asia/Karachi · Pakistan time (UTC+5). All reminders are set for **30 minutes before** your event.
- **Email reminders to myself** (tick): turns Gmail reminders on. Leave it ticked.
- **Sync Google every five minutes** (tick): keeps calendar and inbox current automatically.
- **Save settings:** click after any change.
- **Enable browser notifications:** lets the app also pop a notification in Chrome — this only works while a page is open, so treat it as a bonus, never the main reminder.
- **Export records:** downloads a backup copy of your records. The export contains records only — never sign-in tokens or credentials.

Your first-meeting test — do this once

1. Confirm Connections shows **Connected**.
2. Click **+ New event**. Title it “Reminder test”, and set the start time to **31 minutes from now**, duration 30 minutes. Save.
3. Within seconds, check the Drive worksheet: a new row should be there.
4. About a minute later — when the event is exactly 30 minutes away — the reminder email should arrive in Gmail. Check **Reminder history** to see it recorded.

If all three happen, your whole chain — app, worksheet, reminder — is working. Delete the test event afterwards, or mark it completed.

CHAPTER 8

Reminders explained

Every event carries one simple promise: a reminder 30 minutes before it starts. This chapter explains exactly how that promise is kept — and its honest limits.

When they fire

The running app checks for due reminders every 15 seconds. When an event is 30 minutes away, its reminder is sent once — by **email** (Gmail, to yourself) and shown on the **dashboard**. No reminder is ever sent after an event has already started.

If the laptop was asleep or offline

A reminder can be late if the app or the computer was off when it fell due. When it does go out, its text shows the **actual minutes remaining**, so a late reminder still tells the truth: “in 12 minutes” means 12 minutes, not 30. To avoid late reminders on important days, keep the laptop awake and online — and use Save to Google, below.

What “uncertain” means

Most reminders end as **accepted**: Gmail took the message. Occasionally a delivery is **unconfirmed — “uncertain”**: the app sent it, but Gmail did not confirm receipt. The app deliberately does *not* resend these automatically, because resending a message that actually arrived would spam your own inbox. Instead:

1. Open **Reminder history** and find the entry.
2. Check your Gmail inbox first — the reminder may well be there.
3. If it is genuinely missing, use the **retry** offered on that history entry to send it again, deliberately.

Why Google’s own reminders are a good backup

When you click **Save to Google** on a meeting, Google Calendar creates its own 30-minute email and pop-up reminders. Those run on Google’s computers, not yours: they fire even if your laptop is shut, asleep, or offline, and even if this app is stopped. For any meeting you cannot afford to miss, that independence is exactly what you want standing behind the app’s reminder.

> **The two-layer rule.** App reminder for everything, automatically. Google’s reminder as well, for anything critical, with one click. Between the two, a missed reminder needs two separate systems to fail at once.

CHAPTER 9

Troubleshooting

Most problems have one of six causes. Find what you see, apply the fix, and check again — in that order.

Problem	Fix
The browser says “can’t reach the page”	The black window was closed, so the app is stopped. Double-click **Start-Windows.cmd** again, wait a few seconds, and refresh `http://127.0.0.1:4318`.
First start seems stuck	It is downloading its parts. Give it a full 5 minutes on the very first run, and check the laptop is online. Later starts are almost instant, so a slow start after the first is worth a restart of the app.
Google says access has expired	Normal in test mode, roughly every 7 days. Open **Connections** and click **Sign in with Google** again, choosing asifahmad1@gmail.com. No file upload is needed this time.
The worksheet is not updating	Open **Connections** → **Google Drive worksheet** and click **Sync worksheet now**. Read the status badge there: if it shows an error, the usual cause is an expired Google connection — sign in again, then sync once more.
No reminder arrived	Check, in order: the black window is open; the laptop was awake and online at the due time; **Settings** has “Email reminders to myself” ticked; and **Reminder history** shows the delivery status — retry from there if it is unconfirmed. Chapter 8 explains late and uncertain reminders.
The phone can’t reach the page	Confirm both devices are on the **same Wi-Fi**; confirm the laptop is running **Start-Phone-Access.cmd** (not Start-Windows.cmd) and you typed the printed address exactly; and allow Node.js through Windows Firewall for your private network if asked.

Two more small things

- **An all-day Google event did not appear with a reminder.** All-day events have no start time, so they are not imported automatically. Create a timed event for it manually if you need the 30-minute reminder.
- **The app opened, but the Google account does not match.** The app checks the signed-in account against Settings. Set your Google email in **Settings** to the account you signed in with — asifahmad1@gmail.com — and sign in again from Connections.

> **Still stuck?** Note what you clicked, what you expected, and the exact words of any message on screen. Those three details solve almost any support question quickly — and keep your records safe by never deleting the app or data folders as a “fix”.

CHAPTER 10

Stopping, disconnecting and uninstalling

Stopping the app

Close the **black window**. That is all — the app stops, and with it reminders and syncing, until you start it again with `Start-Windows.cmd`. Closing only the browser does *not* stop the app. Meetings saved to Google keep their own Google reminders either way.

Disconnecting Google

1. Open **Connections** and click **Disconnect**.
2. Optionally, also remove the app from your Google account's connected-apps list, in your Google Account settings.

Disconnecting is reversible — sign in again any time. Your records and the Drive worksheet remain untouched.

Uninstalling — removing everything

1. Stop the app by closing the black window.
2. Delete the app folder — the permanent folder you created in Chapter 3, Step 3.
3. Delete the data folder at `%LOCALAPPDATA%\AsifScheduleAssistant`. Type that address into the File Explorer address bar to reach it. This folder holds your records and the encrypted Google connection — deleting it removes them for good.
4. On your phone, long-press the app icon and remove it. In Google Drive, delete the *Asif Schedule Assistant* worksheet too, if you no longer want it.

> **Before you delete anything:** use **Settings** → **Export records** to keep a copy of your schedule. Deleting the data folder cannot be undone.

Backing up, in normal life

The Drive worksheet is already a live copy of your schedule. For a full local backup, copy the `%LOCALAPPDATA%\AsifScheduleAssistant` folder somewhere safe and keep it private — it holds the key that protects your Google connection.

CHAPTER 11 · TEAR-OFF PAGE

Quick-reference card

Keep this page beside the laptop. Everything daily is here.

Addresses

App on laptop:
`http://127.0.0.1:4318`

Google Cloud:
`https://console.cloud.google.com`

Your account: asifahmad1@gmail.com

Worksheet: Google Drive → *Asif Schedule Assistant*, or Connections → Open worksheet.

Files to double-click

Start-Windows.cmd
Starts the app for laptop use.

Start-Phone-Access.cmd
Starts the app and prints the phone address. Use this one when you want the phone app.

Both live in your Chapter 3 app folder.

The 5 daily actions

1. **Start the day:** double-click the start file; leave the black window open.
2. **Add events: + New event** — title, date, Pakistan time, duration, save.
3. **Protect the critical ones:** open the event → **Save to Google**.
4. **Clear the inbox:** review each suggestion in **Invitation inbox**; approve or dismiss.
5. **Glance before you close:** Overview, for tomorrow at a glance.

The 3 things to remember

> **1. Keep the window open.** The black window is the app. Minimise it freely; close it and reminders stop.

> **2. Keep the laptop awake.** Reminders need the laptop awake and online at the due time. A sleeping laptop means a late reminder.

> **3. Save to Google for critical meetings.** One click gives you Google's own reminders as a backup that works even when the app is off.

Full detail: installation — Chapter 3 · Google connection — Chapter 4 · worksheet — Chapter 5 · phone — Chapter 6 · daily use — Chapter 7 · reminders — Chapter 8 · problems — Chapter 9.
